

Remote Vehicle Diagnostics OBDII↔Ethernet gateway

Conception

«Transparent» OBDII.Subs ↔ TCP/IP gateway

Applications:

- * HaaS (Hardware as a Service)
- * Remote diagnostics online service

System architecture

* Communication server is optional. It allows both sides RVD gateways to use non-global IP addresses and work through NAT and firewalls

RVD gateway common functions

- * All OBDII.Subs messages and metadata packing & unpacking to/from UDP/TCP datagrams;
- * Providing guaranteed delivery and data integrity (ACKs, Resend and others);
- * Network connection status & quality control (echo, PTT measurement test and etc);
- * Protocol recognition till the lowest level which provides flow control for all OBDII.Subs;
- * «Request-response» time control for all possible OBDII.Subs' protocols. Handshake routine in cases, when network latency does not fit protocol requirements.

Main feature: «Transparency» - Just plug & start. No gateway configuring is needed.

OBDII.Subs and protocols tree

RVD gateway covers all stated branches.

Alternatives review

- * Proprietary systems (Vovlo system for Trucks, Launch Golo, etc);
 - work only with manufacturer's vehicles/scanners.
 - a lot of specific, not universal, solutions.
- * SAE J2534 (API) based systems;
 - ignored by vehicle vendors. As a result - narrow applicability.
- * Industrial CAN-Ethernet gateways;
 - do not support OBDII.Subs' protocols. May be used only in reliable network, not in Internet.

Application example#1

«Virtual scanner»

HaaS (Hardware as a Service)

Application example#2

Online Remote Vehicle Diagnostics Service
